Reliable Tax Content
Vertex centralizes all the rates and rules required for accurate calculation of sales and use tax as well as product taxability. With powerful Vertex automation, your tax department will no longer need to manually manage changing tax content. This doesn’t just simplify complex transaction processing within SAP Hybris, but also dramatically reduces the potential for incorrect tax calculation. Utilizing Vertex solutions as part of an overall SAP Hybris deployment reduces risk, streamlines audit processes, increases audit defense, and frees up internal resources to work on higher value projects than tax rate and rule management.

Ease of Use
By leveraging Vertex for SAP Hybris, organizations can enjoy complete integration between the two platforms with no custom work to the eCommerce system. There is no custom engagement required and organizations simply configure SAP Hybris sellable products for proper taxability during the initial, integrated setup process. This effectively removes requirements for the tax department to spend their valuable time manually updating tax schedules within Hybris.

Automated Tax Calculation in Both B2B & B2C Storefronts
The B2B and B2C modules within SAP Hybris are the cornerstones of order entry for organizations leveraging SAP Hybris for their eCommerce storefront. Normally, the tax department has to manage the taxability of each product sold through SAP Hybris, and ensure that tax is properly calculated within both of the B2B and B2C storefronts. However, once Vertex is integrated into SAP Hybris, your solution handles this function automatically, and seamlessly. Vertex supports full sales tax management, regardless of the storefront that is being used, ensuring that every transaction that moves through the B2B and B2C modules has been taxed appropriately.

Integrated Address Cleansing
With any eCommerce solution, the single most critical aspect of tax calculation is jurisdiction identification. Vertex has tightly integrated our unique address cleansing solution into SAP Hybris to ensure that every single transaction has the proper jurisdiction assignment to trigger the accurate tax calculation rules. When you enter new addresses into SAP Hybris, Vertex is able to examine the address, correct for inaccuracies, and return a full 9-digit zip code
and the relevant Tax Area ID. This happens as a seamless part of
the checkout process within the Hybris store, ensuring that bad
addresses don't slip through the order entry system.

**Tax System Implementation**
In addition to developing powerful system integrations, the Vertex
Consulting practice provides Vertex system implementation with
SAP Hybris to help you accelerate the startup and maximize the
value of your Vertex Indirect Tax solutions, whether you require a
cloud or on-premise solution.
