Welcome to Mobile Security

Understanding Mobile Risk

Mobile phones and tablets have become indispensable everyday tools. They are an integral part of life, both personal and professional. These devices know more about us, our habits and our relationships than anyone else.

Mobile Threats

Your phone, just like your laptop, is at risk. There are four threat categories: Phishing, Application, Network, and Device.

Applications that you download and install on your mobile device may contain malicious code or present risks to your corporate or personal information through non-secure data handling or data transfer to third parties. Every network your smartphone connects to has potential to be unsafe. And devices can be compromised by malicious intruders/hackers targeting software vulnerabilities. What's at risk? Your data, such as texts, calls, contacts, photos, emails, financial information and corporate information.
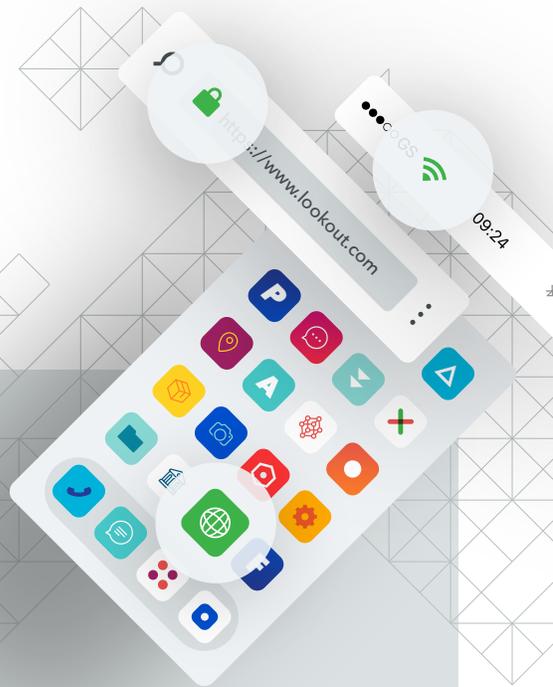

Why do I need Lookout?

Because your mobile device stores so much sensitive information, it's increasingly becoming a target for cyberattacks. Adding Lookout For Work to your mobile device today will identify and minimize these threats and make it difficult for an attacker to steal your data.

What does Lookout do?

The Lookout For Work app scans the operating system, applications, and media on your device for suspicious activity, sending information from those scans to Lookout. Lookout compares that data against a database of known viruses and malware. Lookout then sends information back to your device about issues found and how to fix them. Lookout For Work will also provide that information to your company. Your company will use that information to help you fix the issue and decide whether your device can safely connect to their systems.

What Lookout doesn't do

Lookout firmly believes that your privacy is as important as your security, so we want to be completely transparent about the data we collect to help safeguard your device and the security of each employee. Lookout does not collect the following data types: Image, audio, video files, texts, personal information, or data generated using apps. Lookout for Work won't impact your phone's performance or interfere with data stored on your device.

MOBILE RISKS

Mobile Phishing
With an ever-increasing number of phishing and malware sites – clicking links from apps, emails, text messages, and more can compromise any device.

Downloaded Apps
Everyday apps downloadYX from the Internet can contain malicioi s code or access your personal and corporation information.

Networks
Whether in your favorite coffee shop or your friends house, every network has the potential to be unsafe.

Devices
Out of date operating systems or software vulnerabilities can lead to your device being exploited.
